ABOUT THE PROJECT

A Web-Based Alumni Profile and Event Support System for Strengthening University is a unified, secure platform designed to digitize and centralize all interactions between the university, its organizations, and its alumni. The core function is to replace fragmented, manual processes with an integrated digital solution that streamlines profile management, event coordination, and communication. The system features three strictly enforced roles—Admin (University-level control), Sub-Admin (Organization/Department management), and Alumni (Participant/Member access)—each with defined features and limitations to ensure security and efficient management. The system is built on a responsive interface to ensure accessibility across desktop and mobile devices, providing a robust ecosystem to foster lifelong connections and loyalty between graduates and their alma mater.

PROBLEM STATEMENT

At Caraga State University–Cabadbaran Campus (CSUCC), alumni information and event coordination are still handled through manual forms, spreadsheets, and scattered social media pages. These fragmented methods result in outdated records, inconsistent communication, and difficulty tracking alumni participation. Because there is no unified digital system, administrators and campus organizations struggle to verify alumni information, manage events efficiently, and monitor sponsorships or participation data.

As the CSUCC alumni population continues to grow, these manual processes become harder to maintain and reduce the university's ability to build consistent and meaningful engagement with its graduates. This situation highlights the need for a centralized web-based platform that securely manages alumni profiles, supports event coordination, strengthens communication, and improves transparency among administrators, organizations, and alumni within CSUCC.

OBJECTIVES

General Objective:

To develop a web-based alumni profile and event support system that strengthens engagement and collaboration between the university and its alumni.

Specific Objectives:

1. Create a centralized digital platform where alumni can register, update, and manage their profiles.
2. Allow administrators and sub-administrators to efficiently organize and manage alumni events with automated scheduling and participation tracking.
3. Facilitate communication through announcements, notifications, and feedback features between alumni, organizations, and the university.
4. Evaluate the system's functionality, usability, and overall satisfaction based on feedback from alumni, administrators, and sub-admins.

FLOW OF THE SYSTEM

1.Alumni User Flow

1. Registers → Updates Profile → Views Events → Joins Events → Receives Announcements

2.Sub-Admin Flow

1. Creates Events → Sends Announcements → Manages Organization Members → Submits Event Proposals

3.Admin Flow

1. Approves Events → Manages Users → Oversees Organizations → Generates Reports

4.System Flow

1. All actions stored in centralized databases (Alumni DB, Events DB, Announcements DB, Reports DB)
 2. The system updates dashboards, analytics, and notifications automatically
- This flow visually displays how users interact with the system from login to reporting.
